

Do business with confidence.

LoginShield

We offer a complete authentication solution that you can use to protect accounts from password hacking and phishing attacks.

Passwords are not safe anymore.

81% of hacking related breaches leverage either stolen or weak passwords. There are more than 500 million known passwords collected from hundreds of breaches.

Hackers are more sophisticated now.

91% of data breaches begin with a spear phishing email, which involves detailed research into your organization. Common two-factor (2FA) schemes such as text messages and one-time passwords (OTP) are neutralized by proxy servers.

We are all under attack, every day.

Firewalls and patches aren't going to help if your employees reuse their passwords on other websites and those websites are hacked.

One-tap login

Saves time and prevents mistakes such as entering a password into the wrong website.

Strong multi-factor authentication

Prevents attackers from impersonating people using stolen credentials from a data breach.

Phishing protection

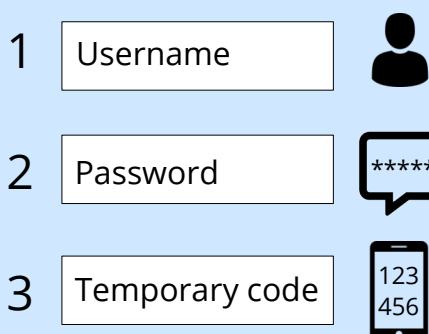

A unique patent-pending system protects users against phishing and proxy phishing attacks, is resistant to SIM-swap attacks, and works on devices without a telephone number.

Seamless disaster recovery

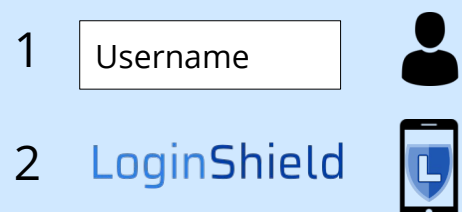

One procedure for users recover credentials for all their LoginShield-enabled accounts instead of resetting each account individually.

Forget passwords.

LoginShield is the most secure and convenient way to login to a website or network application.

Typical login sequence vulnerable to password & phishing attacks

Secure & convenient one-tap login with LoginShield
